

## Lab Exercise 3– Terraform IAM User Setting

**Prerequisites:** Terraform Installed: Make sure you have Terraform installed on your machine. Follow the official installation guide if needed.

AWS Credentials: Ensure you have AWS credentials (Access Key ID and Secret Access Key) configured. You can set them up using the AWS CLI or by setting environment variables.

### Exercise Steps:

#### Step 1: Create a New Directory:

The screenshot shows a code editor window with a dark theme. On the left is a sidebar with icons for file operations like new, open, save, and search. The main area displays a file named 'main.tf' with the following Terraform configuration:

```
1 terraform {  
2   required_providers {  
3     aws = {  
4       source  = "hashicorp/aws"  
5       version = "5.30.0"  
6     }  
7   }  
8 }  
9  
10 # Configure the AWS provider (region/profile set below)  
11 provider "aws" {  
12   region  = "ap-south-1"  
13   access_key = "AKIAVRUVT0Z0YAK5J6GW"  
14   secret_key = "wJalrXutnFEMI/K7MDENG/bPxRf1CYEXAMPLEKEY"  
15 }  
16  
17 }
```

The status bar at the bottom indicates the file is 17 lines long, with the current cursor position at Ln 13, Col 37. It also shows options for Plain Text and Finish Setup.

Create a new directory for your Terraform configuration:

**“Terraform-Demo”**

#### Step 2: Create Terraform Configuration File (main.tf):

Create a file named main.tf with the following content:

This script defines an AWS provider and provisions an EC2 instance.

### **Step 3: Initialize Terraform:**

Run the following command to initialize your Terraform working directory:

```
Initializing provider plugins...
- Finding hashicorp/aws versions matching "5.30.0"...
- Installing hashicorp/aws v5.30.0...
- Installed hashicorp/aws v5.30.0 (signed by HashiCorp)
Terraform has created a lock file .terraform.lock.hcl to record the provider
selections it made above. Include this file in your version control repository
so that Terraform can guarantee to make the same selections by default when
you run "terraform init" in the future.

Terraform has been successfully initialized!

You may now begin working with Terraform. Try running "terraform plan" to see
any changes that are required for your infrastructure. All Terraform commands
should now work.

If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.
dhruvsapra@Dhruvs-MacBook-Air-7:~/Terraform-Demo % terraform init
Initializing the backend...
```
